

**Amendments to the Specification:**

Please replace the title of the application as follows:

Location Based Wireless Network Information Delivery

Please amend paragraph [0030] on page 8, lines 12-23 as follows:

Local server 160 is the computing system that communicates with e-services server 150 to provide a user with access to services available on e-services server 150. Local server 160 is at or near the physical location where mobile unit 110 is located. The location of local server 160 is thus selected and changes based on the physical location of mobile unit 110 at the time the request for access to services available on e-services server 150 is submitted. Depending on the type of service provided, the information forwarded from e-services server 150 to local server 160 may be further processed and transmitted to a point of delivery 170. For example, if a user is staying in a hotel room, system 100 may be utilized to deliver to the user his or her email messages at the television set available in the room. Alternatively, the messages may be delivered to a printer or a computer system in the hotel's business center.
